(Pharmacia) with a modified polylinker; Site_1: Not I; Stle_2: Eco RI: Equal amounts of plasmid DNA from three normalized libraries (melanocyte ZNBHW, pregnant uterus NDHPU, and fetal heart NDHH19W) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization fraction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools of consisted of I.M.A.G.E. clones 260232-265223, and 484488.489479."

/note="Organ: 1900 of vector: p1773D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; Equal amounts of plasmid DNA from three normalized libraries (fetal lung NbHL19W, testis NHT, and B-cell NCI_CGAP_GCBI) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified CDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302087, 682632-687239, 726408-72871, and 729096-731399. Subtraction by Bento Soares and M. Fatima Bonaldo. " Subtraction by Bento

* NOTE: This is a 'working draft' sequence. It currently

* consists of 8 contigs. The true order of the pieces

* is not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* runs of N. but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be preserved.

September 28, 1999, 16:46:31; Search time 303.81 Seconds (without alignments) 5487.080 Million cell updates/sec

US-09-037-657-28 6663 Title: Perfect score: Sequence:

IDENTITY_NUC Scoring table: 311585 segs, 125096042 residues Searched:

N_Geneseq_36:*

Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Tor modulating proliferation, differentiation and survival of cells,

For modulating proliferation, differentiation and survival of cells,

Claim 9: 182pp; English.

Condulating hearthy of chip ception and it.'s

Cherapeutics used for modulating neuronal proliferation, differentiation

Cherapeutics used for modulating neuronal proliferation, differentiation

Cherapeutics used for modulating neuronal proliferation and diagnosis,

```
NR6 is a novel haemopoictin receptor (HR). Interaction between the novel HR and a ligand facilitates proliferation, differentiation and survival of a wide variety of cells. The HR and it's derivatives can be used for modulating the activity of the receptors e.g., to regulate development, maintenance or regeneration in an array of different cells and tissues in vitro and in vivo. They can be present in therapeutics used for modulating neuronal proliferation, differentiation and survival. The products can also be used for detection and diagnosis, e.g. for cancers or predisposition to cancers, or for drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                         11780

                                                                                                                                                                                                                                                                                                                                                                                    T for modulations for the movel is a form of the novel HR NRG.

The haemopoietin receptor (HR) NRG.3 is a form of the novel HR NRG.

The haemopoietin receptor (HR) NRG.3 is a form of the novel HR NRG.

Theraction between the novel HR and a ligand facilitates proliferation, differentiation and survival HR and a ligand facilitates proliferation, differentiation and survival maintenance or regeneration in an array of corresponding to regulate development, maintenance or regeneration in an array of different cells and tissues in vitro and in vivo. They can be present in the charapeutics used for modulating neuronal proliferation, differentiation and survival. The products can also be used for detection and diagnosis, correction and diagnosi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cagiggogigctiggatgcagaagicacacaagacccgaaaccaggiaggaaagiigggg 6053

Claim 5; Page 84-87; 182pp; English.

The haemopoletin receptor (HR) NR6.2 is a form of the novel HR NR6.

Interaction between the novel HR and a ligand facilitates proliferation, differentiation and survival of a wide variety of cells. The HR and it's derivatives can be used for modulating the activity of the receptors e.g. to regulate development, maintenance or regeneration in an array of different cells and tissues in vitro and in vivo. They can be present in therapeutics used for modulating neuronal proliferation, differentiation and survival. The products can also be used for detection and diagnosis, e.g. for cancers or predisposition to cancers, or for drug screening.

New nucleid acid encoding U4 haematopoietin receptor superfamily the nucleid acid encoding U4.

PT chain - potentially useful, e.g. for modulating cell proliferation or immune response, for treating cancer and auto:immune disease.

PT chain 1; Pages 25-26; SBPD; English.

This is the nuclectide sequence encoding the murine U4 protein from the haematopoietin receptor superfamily, used in the method of the immune case of the immune case of the immune case of the immune case of the immune case of the immune case of the immune case of the immune case of the immune case of the immune case of the immune case of the immune case of the immune case of the immune case of the immune case of the immune case of the immune case of the immune diseases, cancer, and allergy).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 7; Page 93-95; 182pp; English.

Claim 7; Page 93-95; 182pp; English.

The nucleotide sequence was generated by a 5N RACE of brain cDNA using NR6 specific primers. NR6 is a novel Haemopoletin receptor (HR).

Interaction between the novel HR and a ligand facilitates proliferation, differentiation and survival of a wide variety of cells. The HR and it's derivatives can be used for modulating the activity of the receptors e.g. to regulate development, maintenance or regeneration in an array of different cells and tissues in vitro and in vivo. They can be present in therapeutics used for modulating neuronal proliferation, differentiation and survival. The products can also be used for detection and diagnosis, e.g. for cancers or predisposition to cancers, or for drug screening.

The present sequence encodes a protein designated Zcytor5, which is a cytokinin-like receptor. Soluble Zcytor5 may be administered to down-requiate the effects of a growth and/or maintenance factor in thyroid, heart, and skeletel muscle for example to lessen the effect of cardiotrophin-1 on cardiac pathologies, so preventing heart enlargement. Zcytor5 could be used to detect cardiotrophin-1 in the blood, and to discover other possible Zcytor5 ligands. A probe and integrity of the Zcytor5 gene on chromosome 19. Antibodies and the and integrity of the Zcytor5 gene on chromosome 19. Antibodies and the therapeutically to andidy 2cytor5 ligand effects.

CC Zcytor5, which is a cytokinin-like receptor. Soluble Zcytor5 may be daministered to down-regulate the effects of a growth and/or maintenance of actor in thyroid, heart, and skeletal muscle for example to lessen the ceffect of cardiotrophin-1 on cardiac pathologies, so preventing heart calculargement. Zcytor5 could be used to detect cardiotrophin-1 in the blood, and to discover other possible Zcytor5 ligands. A probe comprising Zcytor5 DNA or RNA can be used to determine the presence cand integrity of the Zcytor5 gene on chromosome 19. Antibodies and the anti-idiotypic antibody could be used to purify Zcytor5 and the count indiotypic antibody 2cytor5 ligand effects.

CC therapeutically to modify Zcytor5 ligand effects.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Disclosure: Page 63-66; 55pp; English.

The present sequence encodes a protein designated Zcytor5, which is a cytokinin-like receptor: Soluble Zcytor5 may be administered to down-regulate the effects of a growth and/or maintenance factor in thyroid, heart, and skeletal muscle for example to lessen the effect of cardiotrophin-l on cardiac pathologies, so preventing heart enlargement. Zcytor5 could be used to detect cardiotrophin-l in the blood, and to discover other possible Zcytor5 ligands. A probe comprising Zcytor5 DNA or RNA can be used to determine the presence and integrity of the Zcytor5 gene on chromosome 19. Antibodies and the anti-idiotypic antibody could be used to purify Zcytor5 and therapeutically to modify Zcytor5 ligand effects.

CDNA encoding an allelic varaint of human Zcytor5.

Zcytor5: cytokinin-like receptor; down-regulation; growth factor;

maintenance factor; thyroid; heart; skeletal muscle; cardiotrophin-1;
cardiac pathology; heart enlargement; Zcytor5 ligand; allelic varaint;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

               New nucleic acid encoding U4 haematopoietin receptor superfamily chain - potentially useful, e.g. for modulating cell proliferation or immune response, for treating cancer and auto:immune disease claim 1, Page 28; 38pp; English.

This is the nucleotide sequence encoding the human U4 protein from the haematopoietin receptor superfamily, used in the method of the invention for the modulation of cell proliferation or the immune crosponse. Transformed mammalian cells are used to produce recombinant U4 protein is used to stream for specific binding as tissue markers for isolation of cognate ligands and receptors, and in pharmaceutical compositions which may modulate cell proliferation, cell differentiation, and the immune system (e.g. for treating immune deficiency, inherited or the result of infection, autoimmune diseases, connect, and allery).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     29-SEP-1998 (first entry)

```
The NR6 gene encodes a novel Haemopoietin receptor (HR). Interaction between the novel HR and a ligand facilitates proliferation, differentiation and survival of a wide variety of cells. The HR and it's derivatives can be used for modulating the activity of the receptors e.g. to regulate development, maintenance or regeneration in an array of different cells and tissues in vitro and in vivo. They can be present in therapeutics used for modulating neuronal proliferation, differentiation and survival. The products can also be used for detection and diagnosis, e.g. for cancers or predisposition to cancers, or for drug screening. Sequence 1391 BP; 281 A; 459 C; 417 G; 234 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Haemopoletin receptor; cell proliferation; cell differentiation; cancer cell survival; therapeutic; neuronal proliferation; drug screening; ss;

NR6 is a novel haemopoletin receptor (HR). Interaction between the novel
HR and a ligand facilitates proliferation, differentiation and survival
of a wide variety of cells. The HR and it's derivatives can be used for
modulating the activity of the receptors e.g. to regulate development,

New polynucleotides encoding 25-hydroxyvitamin D 1-^a-hydroxylase -
useful to detect and treat vitamin D-related disorders
Example 4, Page 79-81; 85pp; English.

This invention describes novel 25-hydroxyvitamin D 1-alpha-hydroxylase
(1-alpha-OHase), a renal cytochrome P450 enzyme of the vitamin D
pathway, and polynucleotides encoding the enzyme from human, mouse and
rat tissue. Molecules of the invention are used to diagnose and treat
vitamin D-related disorders, to produce vitamin D metabolites, and to
identify modulators of the enzyme expression. The invention describes
an animal cell transformed with the enzyme promoter which is used to
identify compounds which modulate activity of the polynucleotide
encoding the enzyme, and to modulate the production of vitamin D in
patients with vitamin D endocrine disorders in the vitamin D in
patients with vitamin D to alapha 25(0H)2D3.

25-hydroxyvitamin D to 1 alpha 25(0H)2D3.
